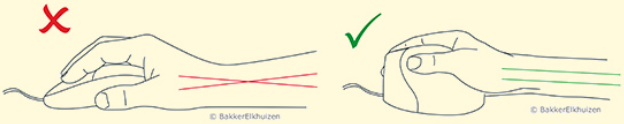
Evoluent D Wireless

The latest wireless version

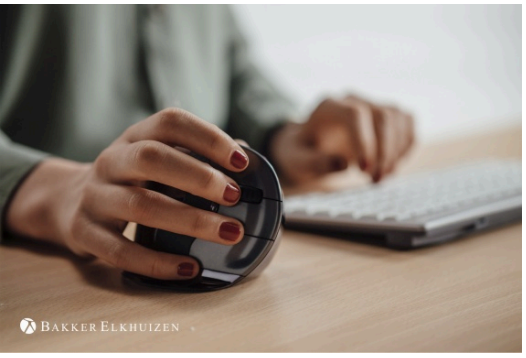
This is the latest wireless vertical mouse. Its design was inspired by more than 18 years of experience and research.

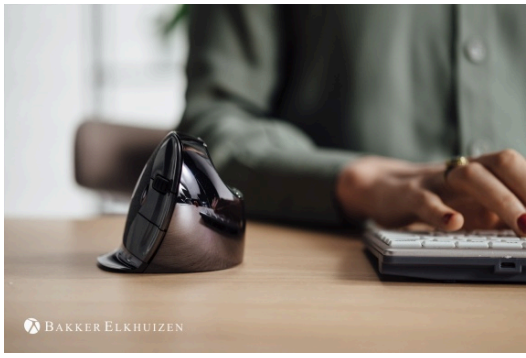
Because the mouse is held in a handshake position, it reduces and prevents (physical) discomfort. The user's wrist bends less from side to side and the lower arm rotates less.



The "handshake" position of this vertical mouse ensures that your wrist bends less from side to side, which means your lower arm rotates inwards less (Schmid et al., 2015). As a result, there is less muscle activity in the lower arm than when using a standard mouse (Quemelo & Vieira, 2013).

Research shows that using a vertical mouse allows users to heal quicker from arm, wrist and hand injuries (Aarås et al., 2001).





The latest wireless version of Evoluent at BakkerElkhuizen

The Evoluent D is made from high-quality materials to create a premium look and feel. Furthermore, this mouse has a very short acclimatisation time. The Evoluent D Wireless is available in two versions, so there is a perfect model for almost all hand sizes. The mouse is only suitable for right-handed users. You use your mouse a lot throughout the day. When using a traditional mouse, you twist your wrists, tense your arms and strain your shoulders. To avoid this, different types of ergonomic mice are available. A vertical mouse is one where the hand is held in a handshake posture.
